## 2009 NCFST ANNUAL REVIEW OF RESEARCH

# TABLE OF CONTENTS

---

### 5 Introduction

### 6 CHEMICAL CONSTITUENTS AND ALLERGENS

- 7 Impact of Processing on Food Allergens
- 13 HILIC HPLC Analysis of Anthocyanins in Pomegranate
- 17 Cleaning and Validation to Prevent Allergen Cross-contact
- 21 Furan Levels in Home-Prepared Foods
- 27 Chemical Inactivation of Protein Toxins on Food-Contact Surfaces

### 32 HEALTH PROMOTING FOODS

- 33 Effect of Processing on Phenolic Compounds in Fruit: Detection and Quantitation of Polyphenolic Compounds in Strawberry Powder Using LC-MS/MS
- 36 Define the Mechanism of Plant Flavonoid on Oxidative Stress- and Inflammatory-mediated Insulin Resistance *In-Vitro* in Human Muscle and Adipose Tissues: A Pre-Clinical Study to Support Future Clinical Studies
- 39 Dietary Fiber Quality on Satiety and Energy Intake in Pre- and Post-Menopausal Women
- 45 Processing on Nutrition Quality of Foods

### 48 MICROBIOLOGY

- 49 Evaluation/Validation of Methods for Decontamination of Food Processing Equipment and Facilities Deliberately Contaminated with *Bacillus* Spores
- 56 A Systems Approach to Minimize *E. coli* O157:H7 Food Safety Hazards Associated with Fresh- and Fresh-cut Leafy Greens
- 67 Post-Harvest Practices to Enhance the Safety of Fresh Tomatoes
- 73 Recovery and Survival of Viruses in Fresh Spinach, Green Onions and Processed Fruits
- 77 The Effect of Temperature History on the Ability of Proteolytic Strains of *Clostridium botulinum* to Produce Toxin in Extended Shelf-life Foods
- 81 Investigation of Norovirus Cross-contamination During Foodservice Procedures Used in the Preparation of Fresh Produce
- 85 Comparative Genomic Analysis of *Listeria monocytogenes* for Survival in Food Processing Environments
- 90 Genetic Factors Regulating *Salmonella* Stress Response
- 94 Genomic Analysis of *Clostridium botulinum*

### 98 FOOD PROCESSING AND PACKAGING

- 99 Framework for Setting and Validation of Sterilization and Extended Shelf-life Processes
- 104 Microwave Pasteurization of Shell Eggs
- 107 Decontamination of Dry Ingredients
- 110 Thermal Characterization of Botulinum Neurotoxin using Differential Scanning Calorimetry
- 112 Inactivation of *Clostridium botulinum* Spores Using High Pressure Processing
- 116 Raw Milk Survey for Four Food Pathogens

## 2009 NCFST ANNUAL REVIEW OF RESEARCH

### TABLE OF CONTENTS (continued)

---

121	Thermal Resistance of <i>Coxiella burnetii</i> in Dairy Products with Differing Levels of Solids and Fat Contents
125	Effect of Solids Levels on the Thermal Resistance of <i>Listeria</i> Species
128	Analysis of Microwave Heating in Foods
130	Effects of Sanitizers and Processing on Viral and Bacterial Pathogens
135	FNS/FDA/NCFST Study on Cooling of Foods in School Foodservice Operations
144	Migration Database of Additives and Contaminants in Food Packaging Systems for Use in Predictive Models
153	Determination of Organic and Inorganic Chemicals Released from Polymer-Clay Nanocomposite Food Packaging

# Introduction

---

The Annual Review of Research contains reports on collaborative research conducted at the National Center for Food Safety and Technology during the fiscal year 2009 (October 1, 2008 through September 30, 2009).

NCFST was established in 1988 to bring together scientists from industry, academia and the US Food and Drug Administration (FDA) to work collaboratively on food safety issues. The center is a unique food research consortium of FDA's Center for Food Safety and Applied Nutrition, Division of Food Processing, Science and Technology, the Illinois Institute of Technology, and the food industry. The science conducted at the center forms a foundation for regulatory policy and establishes the parameters to ensure the effectiveness of food processing and packaging technologies. Industry benefits from the clearly established criteria for evaluating new processes and from a clearer understanding of how regulatory policy is established. FDA benefits from the scientific contributions of industry, and consumers benefit from improved processing and packaging systems that help assure food safety.

NCFST's research is implemented through science platforms that reflect the organization's expertise: food processing and packaging, food microbiology, chemical contaminants and allergens, and health promoting foods. The goal of each of these platforms is to manage a research portfolio of projects based on stakeholders' needs. The center is also well placed to facilitate innovation in the food industry through the assessment and validation of new technologies, especially food safety and preservation technologies, aimed at delivering key consumer drivers of safety, health, freshness and convenience. The center's platform on the science of the health and wellness aspects of foods also adds value to its mission.

Going forward, the NCFST seeks to build on its strong foundation and history of the collaboration with industry, FDA and academia to increase its research portfolio and expand its partnership with its stakeholders. By conducting important research on critical food processing issues to address food safety and nutrition, NCFST can help improve the health and well-being of the public.
